

Introduction

Namespace ClippyCore.Agents

Classes

[Agent](#)

Base implementation of IAgent. Abstracts the use of AxControl from other clients. To create and dispose of Agents, use public AgentManager. [AgentManager](#)

[AgentManager](#)

Static class that properly Creates and Disposes of agents created at runtime. Abstracts other projects from creating Agent objects directly. Use this in projects to create Agents

[Animation](#)

Class with basic data about an Agent's available animations

[TtsAgent](#)

A type of IAgent that has TTS functionality. a TTSLd must be passed and is subsequently registered in AxControl. A list of common TTSLDs can be found in Global.TtsIDs.cs. NOTE: Not all .acs files have TTS capabilities. I will log some in this project but agents outside the scope of this will require trial and error. EX: Clippy does not have TTS, Bonzi Buddy does.

Enums

[AgentType](#)

Enum with values for each agent. When adding a new agent to make available, add an identifier here.
